

## Product Overview: totemodata® SendIt

There are many ways to exchange data. But only few of them are secure. Sensitive information, however, needs to be protected and its movements need to be traceable at all times. Only that way, data exchange can meet company security guidelines and compliance standards. In most organizations, growing employee mobility raises the requirements for securing sensitive data. The users therefore need a comfortable solution for secure file transfer that works on laptops, smartphones and tablets. At the same time, the data should not be saved on external servers that may even be abroad.

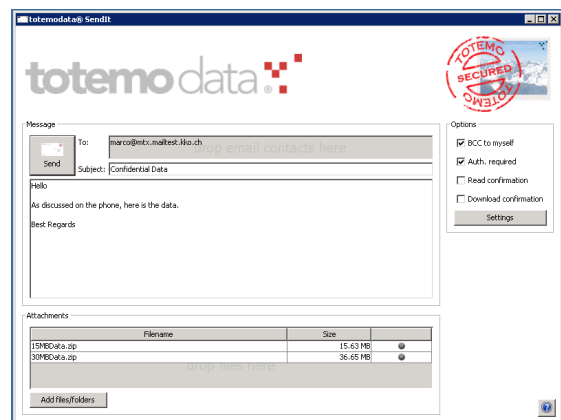

totemodata® SendIt makes secure spontaneous file transfer as easy as sending or receiving an email. Its graphic interface is so intuitive that there is no need for user training. With Drag and Drop for contacts, message content and files and automatic data compression, users can comfortably exchange files and file packages of any volume. As a plus, the data exchange remains transparent at all times due to optional authentication, read and download notifications. totemodata® SendIt works on the basis of totemodata® and is available as a web app or as an app for Windows, Mac OSX and Linux.

### Use Cases

totemodata® SendIt simplifies the secure exchange of sensitive data from human to human. With this app, communication with team members on different sites, colleagues working on-the-go and external partners permanently takes place in a controlled environment. Its intuitive interface increases the chance of people actually using it and thereby observing company security guidelines.

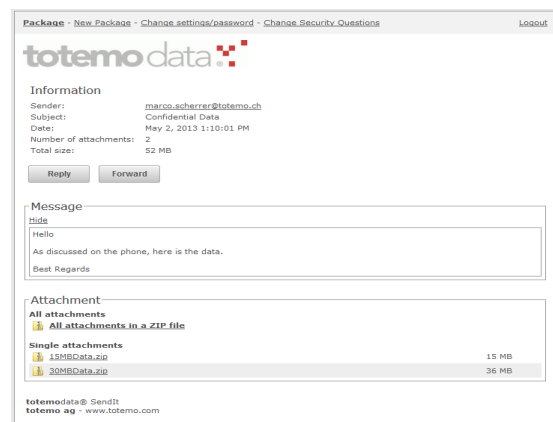

### How It Works

The sender drags the desired contacts and files of any volume onto the application. On typing his message into the text field, he optionally selects authentication, read and download notifications by ticking the respective boxes. The sender can also choose to receive a blind copy to retrace the exchange in his email client. The attached files are then automatically compressed. A click on 'Send' delivers the files using totemodata®.

Sender Screen: totemodata® SendIt

The recipient gets an email with an attachment containing a link. Clicking this link will lead him to the sent files as well as the accompanying message. Any first-time user will find a password in the same email. It is necessary to download the files and needs to be changed immediately. The recipient can directly reply to the sender using the app.

Recipient Screen: totemodata® ReceiveIt

### Benefits

#### Organization

- Great user experience improves observation of security guidelines and compliance standards by employees and external partners
- Data is not stored on external servers, but remains within the company network until it is downloaded

## Administration

- App is easy to install (for web app users and recipients only, no installation necessary at all)
- No user training necessary due to intuitive graphic interface
- Every data exchange is recorded and controlled by **totemodata**<sup>®</sup>

## User

- Easy and comfortable to use
- Improved control over file exchange status (receipt, read notification etc.)

- No full inbox due to big data volume
- All sent data is stored in a single place (for senders and recipients)
- Works on every device including tablets and smartphones

## Architecture

**totemodata**<sup>®</sup> SendIt relies on **totemodata**<sup>®</sup> technology and thus supports all data protocol standards (HTTPS, FTPS, SFTP, SCP, SMTP) and is easily integrated into any organization's existing IT architecture.
